

### **What is alumina grinding ball?**

The alumina grinding ball is produced to replace the natural pebble for ball mill grinding media.

Compared with natural pebble grinding media, the alumina grinding ball has better performance in wear resistance, corrosion resistance, high density and high mechanical strength. The high density and ultra hardness of the alumina grinding ball enable the increase of ball mill loading. The alumina grinding ball is compact and uniform in shape, the collide probability increased and grinding efficient increased. The alumina grinding ball can guarantee less contamination to the raw material and keep them chemical composition stabilized. So the alumina grinding ball is widely used in the glaze grinding, and alumina grinding ball is the key to quality assurance for glaze production.

Quick grinding, electricity saving, cost-effective, the alumina grinding ball is chosen as the most ideal grinding media by more and more enterprises in today industry.
